                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ABT11947
                                    ò
                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention provides a composition comprising one or more antisense oligonucleotides directed against vascular endothelial growth factor (VEGF) where the antisense oligonucleotides inhibits proliferation of cells exhibiting autoorine VEGF activity at an IC 50 concentration of between 0.5-2.5 micro Ma. The antisense oligonucleotides may be directed against VEGF for inhibiting cancer cell proliferation and angiogenesis. Preferably the oligonucleotide AMI23032 (a modified version of AAMI23984) is used and may be utilized to treat Kaposi's sarcoma, ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    prostrate cancer, pancreatic cancer or melanoma. Sequences AAH23012-023 represent gene-specific primers used in RT-PCR amplification of VEGF

The invention comprises a transgenic ungulate containing a xenogenous finamuooplobulin gene which undergoes rearrangement and expresses more than one xenogenous immunoglobulin molecule. The transgenic ungulates of the invention are useful for producing antibodies that are useful for producing antibodies that are useful for propplylaxis/traemment of infectious diseases, modulation of the immune system, removal of cancer cells and modulation of specific human molecules. The present DNA sequence represents a PCR primer that was used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New transgenic ungulates comprising nucleic acids encoding a xenogenous immunoglobulin (Ig) that undergoes rearrangement and expresses xenogenous Ig molecules, useful for producing antibodies for prophylaxis of infectious diseases.

The invention comprises a transgenic ungulate containing a xenogenous immunoglobulin gene which undergoes rearrangement and expresses more than one xenogenous immunoglobulin molecule. The transgenic ungulates of the invention are useful for producing antibodies that are useful for prophylaxis/treatment of infectious diseases, modulation of the immune system, removal of cancer cells and modulation of specific human molecules. The present DNA sequence represents a PCR primer that was used in an example of the invention
                                                                                                                   New transgenic ungulates comprising nucleic acids encoding a xenogenous immunoglobulin (Ig) that undergoes rearrangement and expresses xenogenous Ig molecules, useful for producing antibodies for prophylaxis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Recombinant DNA construct; secretory leader sequence; His tag; infection; therapy; RGDP; secreted replicable genetic display package; vaccination; restriction endonuclease; cleavage site; phage display library;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a recombinant DNA construct coding for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention comprises a transgenic ungulate containing a xenogenous immunoglobulin gene which undergoes rearrangement and expresses more than one xenogenous immunoglobulin molecule. The transgenic ungulates of the invention are useful for producing antibodies that are useful for prophylaxis/treatment of infectious diseases, modulation of the immune system, removal of cancer cells and modulation of specific human molecules. The present DNA sequence represents a PCR primer that was used in an example of the invention
                                                                                                                                                                                                                                                                                                                                                       New transgenic ungulates comprising nucleic acids encoding a xenogenous immunoglobulin (Ig) that undergoes rearrangement and expresses xenogenous Ig molecules, useful for producing antibodies for prophylaxis of infectious diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; PCR; primer; ss; transgenic ungulate; xenogenous immunoglobulin; infectious disease; cancer cell removal.

g 8

Secretory leader sequence, tag, at least two restriction endonuclease cleavage sites, and a component of a secreted replicable genetic display package (RGDP) which, when expressed in frame in a recombinant host craganism, causes the RGDP to display at the surface of the package, the tag and any polypeptide encoded 3' of the tag. The method of the corganism, causes the RGDP to display at the surface of the package, the invention is also useful for producing a member of SBP (specific binding pairs) where the recombinant host construct is expressed in recombinant to host organism or recombinant host cells. The recombinant host organism or constructs prepared with a helper phage and the method involves isolating the RGDPs displaying the tag. The method is useful for manufacturing a phage displaying the tag. The method is useful for manufacturing a phage displayl library where several recombinant DNA constructs prepared using several DNA sequences for components of specific binding pairs, are employed. Members (antibodies or their antigen binding pairs, are employed. Members (antibodies or their antigen binding fragments, or ScPv fragments) of SBP identified have therapeutic or diagnostic applications. The coding sequence may be determined and synthesised in bulk for use as diagnostic or therapeutic agent for treating infection. The SBP members are also useful for isolating and purifying their complementary binding partners which are useful of sequences are used for preparing a library of databases of sequences of sequences are used for preparing a library of databases of sequences are useful for fragment. This library can be examined to determine the identity of the antigen binding fragments are useful for fragment. This library can be examined to determine the identity of the antigen bound by the antibody or its fragment. This great is a possible and antigen beneficed to determine the identity of the antigen beneficed in the generation of human scfv antibodies 88888888888888888888888888888888888

Screening a DNA construct library for single chain monoclonal antibody fusion reagents for regulating transcription in vivo, by using constructs expressing antigen binding domains that target transcriptional activators.

Claim 23; Page 15; 52pp; English

The invention describes a method of screening a DNA construct library for a single chain monoclonal antibody fusion reagent capable of binding a transcriptional associated biomolecule in vivo comprising employing the activity of a transcriptional activator by using constructs that express antigen binding domains of immunoglobulins to target endogenous cranscriptional associated regulatory proteins The method is useful for screening a DNA construct library for single chain monoclonal antibody fusion reagents capable of binding a transcriptional associated content in vivo, or capable of regulating transcription in vivo. The identified single chain monoclonal antibody fusion reagents are useful in affinity purification, drug screening, gene therapy (particularly for contenting the transcription of a gene in vivo), or in diagnosing a physiological disorder manifested by abnormal levels of transcription associated biomolecules. The single chain monoclonal antibody fusion cagents may be used for treating or diagnosing cancer or viral infections (e.g. hepatitis A or B, respiratory syncytial virus (RSV), HV, Junin virus, herpes simplex virus, rubella, Varicella-Zoster virus, measles, dengue virus or Ebola virus infections). This sequence represents a primer used to isolate human single chain variable fragment library

The present sequence is a 3' primer based on a RIPEIb1 PCR product obtained from hamster insulinoma HIT T-15 cells. The primer was used in the cloning of human mmdafa CDNA (see Acc19953). mmdafA cell ABR42043) is a novel insulin gene transcription factor. A claimed method of treating an insulin-related disorder comprises increasing the level, expression or activity of a Maf protein, especially mmdafA, in a subject. The insulin-related disorder is diabetes, hypertension, retinopathy, persistent hyperinsulinaemic hypoglycaemia of infancy (PHHI), insulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to a novel method for the identification of candidate sequences of at least the complimentarity-determining region 3 (CDR3) of antibodies specific against at least 1 antigen produced by a microorganism during an infection or against a vaccine. The method comprises initially the sequencing at least the complementarity
Novel isolated mammalian insulin related transcription factor polypeptide, mMafA, useful for treating an insulin-related disorder in a subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying candidate sequences of antibodies specific against at least antigen produced by a microorganism during an infection or against a vaccine, useful;for treating e.g. HIV, bacterial, viral, or parasitic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human complimentarity-determining region 3; CDR3; microorganism;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           셤
                                                                                                                                                                                                                                                                                     The invention describes a method of screening a DNA construct library for a single chain monoclonal antibody fusion reagent capable of binding a crinityity of a transcriptional activator by using constructs that express antigen binding domains of immunoglobulins to target endogenous cranscriptional associated regulatory proteins. The method is useful for screening a DNA construct library for single chain monoclonal antibody biomolecule in vivo, or capable of regulating transcriptional antibody biomolecule in vivo, or capable of regulating transcription in vivo. The identified single chain monoclonal antibody fusion reagents associated capable of regulating transcription in vivo. The identified single chain monoclonal antibody fusion reagents are useful in segulating the transcription of a gene therapy (particularly for regulating the transcription of a gene therapy (particularly for regulating the transcription of a gene in vivo), or in diagnosing a physiological disorder manifested by abnormal levels of transcription associated biomolecules. The single chain monoclonal antibody fusion associated biomolecules are simple chain monoclonal antibody fusion infections (e.g. hepatitis A or B, respiratory syncytial virus (RSV), HV, Junin virus, herpes simplex virus, rubella, Varicella-Zoster virus, represents a primer used to isolate human single chain antibody variable fragments for used in the creation of a human single chain variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

determining region 3 (CDR3) of the heavy chain variable (VH) and/or light chain variable (VL) coding regions of B cells isolated from at least one patient who has been infected by the microorganism or administered the vaccine. Subsequently, the method comprise correlating the sequences of the CDR3 regions of the VH and VL coding regions of the B cells to identify a set of candidate sequences for at least a CDR3 region of antibodies specific against the antigen produced by the microorganism or antibodies specific and the method of the invention may provide agents with antibodies through use as a vaccine. The antibodies may therefore be useful for manufacturing a medicament for treating an infection caused by a microorganism (for example HIV, bacterial, viral, parasitic or yeast infection), for determining the efficacy of a vaccine, or for vaccinating a patient against an infection by a microorganism. The present sequence is that of a PCR primer which was used to amplify and sequence human VH
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes an isolated nucleic acid (I) comprising single nucleotide polymorphism (SNP) chosen from: (i) a nucleic acid of Salmo salar SNPs, Oreochromis niloticus SNPs or Atlantic halibut SNPs; and (ii) a nucleic acid having nucleotide sequence that hybridises to (i), or its complement under highly stringent hybridisation conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        single nucleotide polymorphism; SNP; fish; Salmo salar; Orechromis niloticus; Atlantic halibut; microsatellite; cod; polymorphic site; seabass; salmonidae; Tilapia; rainbow trout; halibut; detection; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel isolated nucleic acid molecule comprising single nucleotide polymorphism associated with fish, useful for forming PCR primers which are used for detecting single nucleotide polymorphisms in fish nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

CC Also described: (1) an isolated oligonucleotide (II) comprising at least CC inlotticus SNPs, 0. Inlotticus microsatellites; Atlantic hallbut SNPs, 0. Or plotticus SNPs, 0. Inlotticus microsatellites; Atlantic hallbut SNPs, Cod polymorphic sites and seabass polymorphic sites, or their complement; (2) or amplifying a nucleotide sequence chosen from S. salar SNPs and, 0. Inlotticus SNPs, 0. Inlotticus microsatellites, Atlantic hallbut SNPs, cod polymorphic sites and seabass polymorphic sites; and determining (MI) the corrigin of fish sample comprising providing a parentage genotype database comprising a collection of candidate parent genotype database comprising a collection of candidate parent genotype database, where a match between candidate parent genotype to the parentage genotype database, where a match between the sample genotype to the parentage genotype database, where a match between the sample genotype to the parentage genotype database, where a match between the sample genotype and one of the condidate parent genotype in the sample such as family salmonidae, S. salar, Tilapia, O. niloticus, crainbow trout, halibut, seabass and Atlantic cod. (II) is useful for detecting nucleic acid molecule comprising SNP in a sample, which crainvolus nucleic acid molecule comprising snotleic acids with one or more (II) derived from nucleotide sequence of S. salar SNPs and O. niloticus SNPs, and identifying nucleic acid molecule comprising a polymorphic acids with one or more (II) which is derived from O. niloticus SNPs, Atlantic halibut SNPs, cod polymorphic acides with one or more (II) which is derived from O. niloticus SNPs, Atlantic hilbut SNPs, cod polymorphic acides with one or more (II) which is derived from O. niloticus SNPs, Atlantic hilbut SNPs, cod polymorphic acides with one or more (III) which is derived from O. niloticus sites, and identifying nucleic acide molecule comprising a microsatellite sequence in sample. Comprising a microsatellite sequence in sample. The present sequence is sequence of S. sup

from a human gene having any one of 335 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligonucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1220 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo, and a microarray equipped with the SNP containing oligo. The isolated human gene of the invention is useful for detecting the single nucleotide polymorphisms in human gene. The isolated human gene is also useful for disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polymorphism in a human gene. This polymorphism is a human gene. This polymorphism con of the PCR primers used in the single nucleotide polymorphism
The invention relates to a novel polynucleotide isolated and purified

New composition comprising an antisense oligonucleotide directed against vascular endothelial growth factor, useful for preparing a composition Example 12; Page 19; 54pp; English vascular endothelia for treating cancer

The invention relates to a composition comprising an antisense oligonucleotide directed against vascular endothelial growth factor (VEGF). The antisense oligonucleotide is useful for preparing a composition treating cancer, neoplastic proliferation, abnormal cellular proliferation and preventing analogenesis. The present sequence is a reverse transcriptase (RT)-PCR primer for a VEGF or related gene, used to

The invention relates to assessing a culture of undifferentiated primate pluripotent stem cells (PPS, e.g. embryonic stem cells), involving capteression of markers (MR1) e.g. Zic family member 3 (ZIC3), as given in specification, other than human telomerase reverse transcriptase (MR2) and as excipto or podocalyxin-like protein and hrERT and/or Oct3/4 or second marker chosen from (MR2). Also included are maintaining (M2) or second markers (MR2) at a higher level, FOXOLA, ZIC3, hypotherical protein FLJ20582, Forkhead box H1 (FOXH), Zinc finger protein, Hsal2, KRAB-zinc finger protein SZF1-1 or zinc finger protein Gerebellum (ZIC2, or any other marker (WR4) chosen from PHD protein Jade-1, (Jade-1), causing pPS cells (ZNF300), etc., as given in the specification), causing pPS cells (ZNF300), etc., as given in the tissue type by causing them to express one of the markers chosen from

Core promoter element binding protein (COPEB), etc., as given in the cope promoter element binding protein (COPEB), etc., as given in the cope promoter element binding protein (COPEB), etc., as given in the cope appearation), maintaining PBS cells in a pluripotent state (involves culturing PBS cells or their progeny in the presence of a normally differentiation of human embryonic stem (hES) cells, chosen from children per content of the specification), causing pBS cells to differentiate from commally secreted protein that is encoded by a gene that up-regulated upon the specification), causing pBS cells to differentiate (involves culturing pPS cells or their progeny in the presence of a normally secreted protein that is encoded by a gene that up-regulated upon to protein 1 gene, KlaAd085 protein gene, Fax 19) gene, etc., as given in the specification), causing an encoding sequence to be preferentially expressed in undifferentiated cells, causing an encoding sequence to be preferentially expressed in differentiated cells, cope proliferate without differentiation is dentifying genes that are up or secreted during (M4) differentiated cells from less differentiated cells from less differentiated cells from serving (M4) differentiated cells from less differentiated cells from less differentiated cells from less differentiated cells from a sessing culture of ppg-lation, identifying genes that are up or down regulated during differentiation, identifying genes that are up or come of proliferate without differentiated primate pluripotent seem cells and sassessing culture of ppg-lation of ppS cells from human patient of ppg-lation and assessing culture of undifferentiated primate pluripotent seem cells and from a human patient suspected of having a clinical condition related to abnormal cell growth. The method further involves determining whether the patient has a malignancy from the marker expression. The present sequence is an RTO-PCR probe (realtime quantitative).

                                                                                                              The present invention relates to a new transgenic ungulate which comprises one or more nucleic acids encoding all or part of a xenogenous immunoglobulin (Ig) gene which undergoes rearrangement and expresses more than one xenogenous Ig protein. The transgenic ungulate is useful in producing large quantities of xenogenous antibodies, e.g., human antibodies. The present sequence is a PCR primer used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    comprises one or more nucleic acids encoding all or part of a xenogenous immunoglobulin (Ig) gene which undergoes rearrangement and expresses more producing large quantities of xenogenous antibodies, e.g., human antibodies. The present sequence is a PCR primer used in the exemplification of the invention

The present invention describes a bovine (I) or a bovine cell (II), comprising a non-naturally occurring mutation in one or both alleles of comprising a non-naturally occurring mutation in one or both alleles of an endogenous prion nucleic acid. Also described: (I) a hybriddoma (III) comprising (II); and (4) a nucleic acid (IV) comprising (III); casette which includes in 5'-3' order a first region of homology having cubstantial sequence identity to a first region of homology having substantial sequence identity to a second region of homology having substantial sequence identity to a second region of homology having substantial sequence identity to a second cregion of prion nucleic acid, first region of homology is longer than second region of homology, where the cassette is capable of integrating into an endogenous prion nucleic acid of cell. (I) is useful for crecovering antibodies, which involves administering one or more antigens of interest to (I) comprising nucleic acid encoding a xenogenous antibodies from (I). The antibodies are monoclonal crecovering xenogenous antibodies from (I). The antibodies are monoclonal crecovering xenogenous antibodies from (I). The antibodies and source of antigen. (I) is useful as source of agricultural products and as human antibodies for pharmaceutical use. (I) is a safe source of agricultural products and as human antibodies for pharmaceutical use. (I) is a safe source of agricultural products and as human antibodies con human antibodies and as human anti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel transgenic bovine or bovine cell comprising non-naturally occurring mutation in one or both alleles of endogenous prion nucleic acid, useful as safe source of agricultural products and human antibodies for pharmaceutical use.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (I) has resistance to prion-related disease such as bovine spongiform encephalopathy (mad cow disease). The present sequence represents a PCR primer used in the introduction and rearrangement of HAC, which is used

RESULT 962
```

The present invention describes a bovine (I) or a bovine cell (II), comprising a non-naturally occurring mutation in one or both alleles of an endogenous prion nucleic acid. Also described: (I) a hybridoma (III) formed from the fusion of (II) with myeloma cell; (2) producing (M1) (I); (3) producing (M2) (II); and (4) a mucleic acid (IV) comprising a cassette which includes in 5'-3' order a first region of homology having substantial sequence identity to a first region of homology having substantial sequence identity to a first region of homology having substantial sequence identity to a second region of homology having substantial sequence identity to a second region of homology where the cassette is capable of integrating region of homology, where the cassette is capable of integrating into an endogenous prion nucleic acid of cell. (I) is useful for producing antibodies, which involves administering one or more antigens of interest to (I) comprising nucleic acid encoding a xenogenous antibody gene locus, the nucleic acid segments in gene locus undergo rearrangement resolving in the production of antibodies specific for the antigen and recovering xenogenous antibodies from (I). The antibodies are monoclonal or polyclonal antibodies. The antibodies are recovered from the serum or milk of bovine. The immunoglobuling (Igs) are directed against a desired milk of bovine. The immunoglobulins (Igs) are directed against a desired antigen. (I) is useful as source of agricultural products and source of human antibodies for pharmaceutical use. (I) is a safe source of agricultural products and as human antibodies for pharmaceutical use, as (I) has resistance to prion-related disease such as bovine spongiform encephalopathy (mad cow disease). The present sequence represents a PCR primer used in the introduction and rearrangement of HAC, which is used in an example from the present invention

occurring Novel transgenic bovine or bovine cell comprising non-naturally occurring mutation in one or both alleles of endogenous prion nucleic acid, useful as safe source of agricultural products and human antibodies for pharmaceutical use.

Example 2; SEQ ID NO 24; 307pp; English

comprising a non-naturally occurring mutation in one or both alleles of an endogenous prion nucleic acid. Also described: (1) a hybridoma (III) formed from the fusion of (II) with myeloma cell; (2) producing (MI) (1); (3) producing (M2) (II); and (4) a nucleic acid (IV) comprising a cassette which includes in 5'-3' order a first region of homology having substantial sequence identity to a first region of an endogenous prion nucleic acid of a bovine cell, positive selection marker and second region of prion nucleic acid, first region of homology is longer than second region of homology, where the casette is capable of integrating second region of homology, where the casette is capable of integrating into an endogenous prion nucleic acid of cell. (1) is useful for producing antibodies, which involves administering one or more antibods of interest to (1) comprising nucleic acid encoding a xenogenous antibody gene locus, the nucleic acid segments in gene locus undergo rearrangement resulting in the production of antibodies specific for the antigen and recovering in the production of antibodies specific for the antigen and or polyclonal antibodies. The antibodies are recovered from the serum or milk of bovine. The immunoglobulins (Igs) are directed against a desired antigen. (I) is useful as source of agricultural products and source of agricultural products and source of agricultural products and as human antibodies for pharmaceutical use. (I) is a safe source of agricultural products and as human antibodies for pharmaceutical use. (I) has resistance to prion-related disease such as bovine spongiform The present invention describes a bovine (I) or a bovine cell (II)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to novel antibody sequences, which acts against lesioned tissue. Also claimed is a method (MI) for isolating polynucleotide encoding the antibodies, which involves (a) isolating B cells that is infiltrated into lesioned tissue, and (b) acquiring polynucleotide that encodes an antibody from the isolated B cells. The antibodies are useful for treating cancer lesions, arteriosclerosis, inflammatory disease or autoimmune disease. The present sequence was used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isolating polymucleotide that encodes antibody which acts against lesioned tissue, involves isolating B cells that is infiltrated into lesioned tissue, and acquiring polymucleotide that encodes antibody from
encephalopathy (mad cow disease). The present sequence represents a PCR primer used in the introduction and rearrangement of HAC, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                         Cytostatic; Antiarteriosclerotic; Antiinflammatory; Immunosuppressive; human; antibody; cancer lesion; arteriosclerosis; inflammatory disease; autoimmune disease; cancer; primer; ss.

/*tag= a /label= RNA

```
The present sequence is one of a number of oligonucleotides which were used for the generation of RNA-protein fusions, including fusions having used for the generation of RNA-protein fusions comprise a protein covalently any or epitope tag. The RNA-protein fusions complished by synthesis and in vitro or in situ translation of an mRNA molecule with a peptide and in vitro or in situ translation of an mRNA molecule with a peptide acceptor attached to its 3' end. The RNA-protein fusions are incubated under high salt conditions to produce a protein library. This method is useful for improving or altering existing proteins, as well as for isolating new proteins and nucleic acid or small molecule targets. It may can be used to improve human or humanised simple-chain antibodies for the treatment of a number of diseases. The method is useful for the case and cloning new genes on the basis of protein-protein interactions. Unlike prior art, the new method does not rely on complex, which is very fragile and is therefore of limited use. The method does not rely on topological links between the protein and the nucleic acid so that the information of the protein is retained and can conclete acid in readable, nucleic acid form
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites is estimated at >100,000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information of commetream of the microsatellite sequence were used to generate the carpired PCR primers for in vitro amplification of the corresp.

The sequence were used to generate the microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. screening a library of bovine MoI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MbOI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for oa. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequence upstream and downstream of the microsatellite sequence were used to generate the microsatellite (using the program Optibication of the corresp. microsatellite (using the program Optibication and individuals, for parentage testing, and in the genetic

                                                                                                                                                                                                                                                                                                                           셤
                                                                                                                                                                                                                        The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between 250 and 500
by with an (ACJIS and a (TC)15 oligomucleotide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100,000. The sequence information
cross-fication and indexed herein (see below). The sequence information
cross-fication and indexed herein (see below). The sequences upstream and
downstream of the microsatellite sequence ware used to generate the
required PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTIPRIM). The microsatellites may be
used to identify individuals, for parentage testing, and in the genetic
mapping of economic trait loci, or genes involved the determinism of
economically important traits esp. in cattle, to allow selective
breeding. See also AAQ33501-34437. (Updated on 25-WAR-2003 to correct PN'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                              Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Purine; pyrimidine; methylphosphonate; MP; triple helix; translation;

(Set 1:G2019 and R139; Set 2:G2018 and R139; Set 2:G2018; Set 2
                                                                                                                                                                                                                                                                  Two sets of methylphosphonate oligonucleosides ("MP oligomers") and complementary ribooligonucleosides ("RNA oligomers") contg. alternating purines and pyrimidines were examined for their ability to form triple helix complexes. (Set 1:G2019 and R138; Set 2:G2018 and R139; see AAQG8235-38). It was shown that MP oligomers contg. alternating purines and pyrimidines are capable of forming triple stranded complexes with complementary RNA oligomers. (Updated on 25-MAR-2003 to correct PN

complementary ribooligonucleosides ("RNA oligomers") contg. alternating purines and pyrimidines were examined for their ability to form triple helix complexes. (Set 1:G2019 and R138; Set 2:G2018 and R139 - see AAQ68235-38). It was shown that Williams contg. alternating purines and pyrimidines are capable of forming triple stranded complexes with complementary RNA oligomers. (Updated on 25-WAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                          Detection, recognition, inhibition and alteration of single and double stranded target nucleic acid sequences - by formation of a triple helix structure using 2 oligomers which block translation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Two sets of methylphosphonate oligonucleosides ("MP oligomers") and complementary ribooligonucleosides ("RNA oligomers") contg. alternating purines and pyrimidines were examined for their ability to form triple helix complexes. (Set 1:G2019 and R138; Set 2:G2018 and R139 - see AAQ68235-38). It was shown that MP oligomers contg. alternating purines and pyrimidines are capable of forming triple stranded complexes with complementary RNA oligomers. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detection, recognition, inhibition and alteration of single and double stranded target nucleic acid sequences - by formation of a triple helix structure using 2 oligomers which block translation.

The invention relates to a substantially purified or isolated nucleic acid (1) from ryegrass or fescue species including a simple sequence repeat (SSR), having 2 or more tandemly repeated nucleotide core elements 2-6 nucleotides in length. Also included are a nucleic acid primer suitable for amplifying an SSR, identifying (M1) an SSR by preparing a library of ryegrass or fescue genomic DNA enriched for SSRs and identifying clones in the library containing SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs prepared by the M1, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely associated with the gene such that the SSR and the gene are associated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a
                    method which is not dependent on base sequences, then selection of the statellite sequences from the obtained genomic library of high homogeneity. The method is useful for the isolation of microastellite DNA sequences which can be used as DNA markers. The new method markedly improves the efficiency of isolation of satellite sequences in comparison to prior art methods which are reliant on base sequences. Sequences AA296483-514 represent sequences from Haliotis discus, used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SSR; ryegrass; fescue; tandem repeat; seed batch purity testing.

                                                                                                                                                                                                                                                                                                                                                 The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. The sequences AAT66084-T66107 represent repeat sequences of low informativeness found in specific human apenes. This repeat sequence is found in the ADP/ATP translocase gene. The sequence is amplified by primers AAT66091-2. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Isolation of satellite sequences from genomic DNA for use as DNA markers comprises isolating a library with high homogeneity by DNA fragmentation.

method for DNA profiling grass or cereal species varieties by assessing variation between SSR varieties and testing the purity of grass or cereal seed batches by assessing variation within seed batch of an SSR. The SSRs may be used in the selection of genes in grass or cereal breeding, for profiling grass or cereal species varieties, for testing the purity of grass or cereal seed batches, and for DNA profiling to establish the electronic and for DNA profiling to establish the sequence is a ryegrass or fescue SSR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention discloses a method for generating five prime biased tandem tag libraries of cDNAs. The step involves isolating a sample of mRNAs, amplifying the released tags, concatenating the amplified tags to form concatenated tags, amplifying and isolating the concatenated tags. The present sequence is human carboxypeptidase A3 tandem tag DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Generating five prime biased tandem tag libraries of cDNAs by isolating sample of mRNAs, amplifying the released tags, concatenating the amplified tags to form concatenated tags, amplifying and isolating the

The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers pecifically priming and allowing amplification of each Voeta gene. VertaRNA or CDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases. Concluding autoimmune disease, hypersensitivity diseases, infectious diseases and neoplastic diseases. Hypersensitivity diseases, infectious diseases, arrophic gastritis. Degenerative nervous system diseases include Multiple atrophic gastritis Degenerative nervous system diseases include multiple atrophic gastritis and as contact with allergens that lead to allergies, Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by viruses such as HIV, fungal infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a

The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each 'Deta gene, UperaRNA or cDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases.

The rejection and disease, hypersensitivity diseases, infectious diseases including autoimmune diseases, hypersensitivity diseases, infectious diseases, and neoplastic disease. Hypersensitivity diseases include multiple atrophic gastritis. Degenerative nervous system diseases include multiple strophic gastritis as contact with allergens that lead to I hypersensitivities such as contact with allergens that lead to allergies. Type II hypersensitivities such as those present in allergies a syndrome and Type IV hypersensitivities such as those caused by viruses such as HIV, fungal infections at those caused by
                                                                         ·;

```
The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (I) that includes PML, using cas template a DNA sample containing at least one segment of (I); and determining the length of the resulting amplicon(s). Also described are: a method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or predisposition to a disease, associated with a gene that includes one or core PML. The method is used to identify microsatellite markers, in a include PML. The method is used to identify microsatellite markers, in a disease and for predisposis of such diseases, especially prion diseases of the predisposis of such diseases, especially prion diseases but also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins.

Cometabolic diseases; also to type genes that encode milk proteins.

Cometabolic diseases; also to type genes that encode milk proteins.

Comparising a polymorphic microsatellite locus.
                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Typing genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining
the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain,
                                                                         breast. The present sequence represents a Vbeta gene repeat sequence.
                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 by with an (AC115 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites and microsatellites is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellite is summarised in the specification and indexed herein (see below). The sequence information consumerream of the microsatellite sequence were used to generate the countried PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 by with an (ACL)15 and a (TCL)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine ganome is estimated at >100,000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information for ca. 230 such bovine microsatellites is summarised in the sequence of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

The microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. This invention describes have a comprising (a) an RhaseH-activating region (R1) of at least 3 consecutive 2' unsubstituted mucleosides region (R2) of at least 3 consecutive 2' unsubstituted mucleosides (connected by charged internucleosides inth at least one chirally selected internucleoside link. The oligomucleosides of the invention have base sequences complementary to that of tearget RNA. The products of the invention are used to inhibit transcription of target RNA in a cell or organism, they are antisense molecules that also activate RNaseH.

Particularly the oligomucleosides are used in diagnosis and treatment of disease associated with endogenous or foreign gene expression. Use against human papilloma virus is exemplified. The modified internucleoside links improve target specificity, potency and binding internucleoside links improve target specificity, potency and binding resistant to nuclease and so have better in-vivo lifetimes. The chirally resistant to nuclease and so have better in-vivo lifetimes. The chirally elected linkages in R2 allow control of binding affinity. ARASE6855-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus;

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. The sequences AAT66084-T66107 represent repeat sequences of low informativeness found in specific human genes. This repeat sequence is found in the angiogenin gene located at chromosomal position 14q11-q13. The sequence is amplified by primers AAT66100-1. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            internucleosidyl linkage; chirality; hybridization; racemic;
                                                                                                                                                                                                                                                         Detection of polymorphic genetic markers of the form (dC-dA) \, n \, (dG-dT) \, n using novel nucleic acid mols. as primers.

The invention provides methods for preparing oligomers having phosphonate internucleosidyl linkages of a preselected chirality which hybridize to a target RNA sequence. The method of making comprises: (a) synthesizing a nucleoside dimer, trimer, or terramer with racemic internucleosidyl phosphonate linkages; (b) purifying the racemic nucleoside to a chirally pure nucleoside; and (c) sequentially linking at least 2 of the chirally pure nucleosides to form a synthetic oligomer that is enriched for phosphonate internucleosidyl linkages of a preselected chirality and is complementary to an RNA target sequence. The methods are useful for providing chirally enriched synthetic oligomers RP chirally enriched synthetic oligomers RP compared to oligomers have enhanced binding affinities for RNA compared to oligomers with racemic all methylphosphonate internucleosidyl linkages.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequences AAX91054-75 represent oligomers chemically synthesised using

Analyzing genomic DNA in a sample, useful for analyzing genes of organisms (e.g. a species or individual) or identifying endangered animals or plants, by using oligonucleotide primers comprising universal variable fragments.

Example 1; Page 6; 23pp; English.

The patent discloses a method and associated kit for analysing genomic DNA in a sample. The method comprises conducting a nucleic acid amplification on the genomic DNA in the sample using both first and

second oligonucleotide primer to produce DNA fragments based on repeat sequences on at least one end of the genomic DNA. The first primer is a 5' variation generator including a repeat sequence and at least one nonrepeat nucleotide. The second oligonucleotide primer is a 3' fragment generator starting within such a genetic distance that amplification of the genomic DNA can be performed and preferably includes inosine. The method is useful for the genetic analysis of an individual organism, particularly of a species or individual. It is also useful for the rapid and straight forward identification of endangered animals or plants. The present DNA sequence is a 5' variation generator oligonucleotide PCR primer 888888888888888

The method comprises conducting a nucleic acid semplification on the genomic DNA in the sample using both first and second oligonucleotide primer to produce DNA fragments based on repeat sequences on at least one end of the genomic DNA. The first primer is a 5' variation generator including a repeat sequence and at least one nonrepeat mucleotide primer is a 3' fragment generator scarting within such a genetic distance that amplification of the genomic DNA can be performed and preferably includes inosine. The method is useful for the genetic analysis of an individual organism, particularly of a species or individual. It is also useful for the rapid and straight forward identification of endangered animals or plants. The present DNA sequence is a 5' variation generator oligonucleotide PCR present DNA sequence is a 5' variation generator oligonucleotide PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Analyzing genomic DNA in a sample, useful for analyzing genes of organisms (e.g. a species or individual) or identifying endangered animals or plants, by using oligonucleotide primers comprising universal

The patent discloses a method and associated kit for analysing genomic DNA in a sample. The method comprises conducting a nucleic acid amplification on the genomic DNA in the sample using both first and second oligonucleotide primer to produce DNA fragments based on repeat sequences on at least one end of the genomic DNA. The first primer is a 5' variation generator including a repeat sequence and at least one nonrepeat nucleotide. The second oligonucleotide primer is a 3' fragment generator starting within such a genetic distance that amplification of the genomic DNA can be performed and preferably includes inosine. The method is useful for the genetic analysis of an individual organism, particularly of a species or individual. It is also useful for the rapid and straight forward identification of endangered animals or plants. The
                                                                                                                                                                                                                                                                                                                                          and straight forward identification of endangered animals or plants. present DNA sequence is a 5' variation generator oligonucleotide PCR

Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a Disclosure; SEQ ID NO 557; 164pp; English.

including autoimmune diseases, degenerative nervous system diseases, graft versus host disease, hypersensitivity diseases, infectious diseases and neoplastic diseases. Autoimmune diseases include Addison's disease, atrophic gastritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include multiple allergies, Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those present in mifested in leprosy. Infectious diseases include viral infections caused by viruses such as HIV, fungal infections such as those caused by viruses caused by arasitic infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as cancer of the brain, such as leukaemias, lymphomas and cancers such as cancer of the brain breast. The present sequence represents a Vbeta gene repeat sequence. The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, VbecaRNA or CDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases

AAV2662-V26667 are primers used in the construction of plasmid pICNY which is used in a novel method of detecting the presence of a target PS112 polymucleotide in a test sample. The method can also be used to detect mRNA of PS112 in a test sample. The method can be used for diagnosis of prostate cancer, as the presence of PS112 is an indicator of prostate cancer. Antibodies against the polypeptides may be used as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Prostate; disease; PS112 gene; detection; diagnosis; cancer; treatment;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers associated diseases which comprises a panel of nucleic acid primers becilitacally priming and allowing amplification of each Vbetage gene, VbetaRNA or CDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases, graft versus host disease, hypersenativity diseases, infectious disease, and neoplastic disease. Autoimmune diseases include Addison's disease, atrophic gastritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivities such as those present in allorgies, Type II hypersensitivities such as those present in allorgies, Type II hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections manifested in leprosy. Infectious diseases include viral infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a

This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating a compatison pair comprising genomic DNA from tunour cells and genomic DNA from tunour cells and genomic DNA from normal cells. The method involves the cells from the same individual with oligonucleotide primers selected from adamine and same individual with oligonucleotide purimes selected from adamine and x = 3.7 (3) a nucleotide sequence (CG)xRY, where R is as in (1) and X is a pyrimidine selected from cytosine, thymine, and uracil and x = 3.7, (iv) a nucleotide sequence (CG)xRY, where R is as in (1) and x = 3.7, (iv) a nucleotide sequence (CG)xRY, where R is a pyrimidine selected from cytosine, thymine, and uracil and x = 3.7, (v) a nucleotide sequence (CA)xRY, where R is a purime selected from cytosine, (vi) a nucleotide sequence (CA)xRY, where R is a purime selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where R is a purime selected from adenine and guanine and Y is a pyrimidine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where R is a purime selected from adenine and continue selected from adenine and via a purime selected from adenine and via a purime selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, and (ix) a combination of the primers. The method is useful for detecting genomic instability which are commonly associated with the various stages of neoplastic transformation and carcinogenesis. The method is rapid and simple

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Instanting and comparison of microsareline alterations by treating a comparison pair comporising genomic DNA from tumour cells and genomic DNA from normal cells. The method involves the cells from the same individual with Oligonucleotide sequence (CG) xRG, where R is a purine selected from adenine and guanine and x = 3-7, (ii) a mucleotide sequence (CG) xRY, where R is as in (i) and Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (iii) a nucleotide sequence (CG) xRY, where R is as in (i) and X = 3-7, (iv) a nucleotide sequence (CG) xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence (CG) xRY, where R is a purine selected from cytosine, thymine, and uracil, and x = 6-16, (vi) a nucleotide sequence (CA) xRY, where R is a purine and guanine and X = 6-16, (vii) a nucleotide sequence (CA) xRY, where R is a purine selected from adenine and guanine and x = 6-16, (vii) a nucleotide sequence (CA) xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, (vii) a nucleotide sequence (CA) xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, (vii) a nucleotide sequence (CA) xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, (vii) a nucleotide sequence (CA) xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, and (ix) a combination of the primers. The method is useful for detecting genomic instability which are commonly associated with the various stages of neoplastic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating a

This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating a comparison pair comprising genomic DNA from tumour cells and genomic DNA from normal cells. The method involves the cells from the same individual cutton normal cells. The method involves the cells from the same individual control of primers selected from adenine and selected from adenine and quanine and x = 3-7 (ii) a nucleotide sequence (CG)xRX, where R is as in (i) and Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (iv) a nucleotide sequence (CG)xXY, where R is as in (i) and X = 3-7, (iv) a nucleotide sequence (CG)xYY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence (CG)xXY, where R is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (vi) a nucleotide sequence (CA)xRY, where R is a purine selected from adenine and guanine and Y is a pyrimidine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where R is a pyrimidine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, and (ix) a combination of the primers The method is useful for detecting genomic instability which are commonly associated with the various stages of neoplastic transformation and carcinogenesis. The method is rapid and simple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Primer; quantitation; genetic instability; tumour cell; detection; neoplastic transformation; carcinogenesis; DNA/RNA hybrid; ss.

This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating a comparison pair comprising genomic DNA from thmour cells and genomic DNA from thmour cells and genomic DNA from thmour cells and genomic DNA from thmour cells. The method involves the cells from the same individual with oligonucleotide primers selected from defining and guanine and x = 3-7 (dix) a nucleotide sequence (CG)xRX, where R is as in (i) and X is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (iii) a nucleotide sequence (CG)xRX, where R is as in (i) and X is a nucleotide sequence (CG)xRX, where R is a purine selected from cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence (CG)xRX, where R is a purine selected from definine and guanine and X is a pyrimidine selected from definine and guanine and Y is a pyrimidine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRX, where R is a purine selected from adenine and guanine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRX, where R is a pyrimidine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRX, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, and (ix) a combination of the primers. The method is useful to detecting genomic instability which are commonly associated with the various stages of neoplastic transformation and carcinogenesis. The method is rapid and simple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Primer; quantitation; genetic instability; tumour cell; detection;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating a comparison pair comparising genomic DNA from tumour cells and genomic DNA with oligonucleotide primers selected from (i) a nucleotide sequence (CG)xRX, where R is as in (i) and x = 3-7 (ii) a nucleotide sequence (CG)xRX, where R is as in (i) and x = 3-7, (ii) a nucleotide sequence (CG)xRX, where R is a primitatine selected from cytosine, thymine, and uracil and x = 3-7, (iv) a nucleotide sequence (CG)xRX, where R is a purime selected from cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence (CA)xRX, where R is a purime selected from adenine and guanine and x = 6-16, (vi) a nucleotide sequence (CA)xRX, where R is a purime selected from adenine and x = 6-16, (vii) a nucleotide sequence (CA)xRX, where R is a purime selected from denine and guanine and x = 6-16, (vii) a nucleotide sequence (CA)xRX, where R is a purime selected from denine and guanine and x = 6-16, (vii) a nucleotide sequence (CA)xRX, where R is a purime selected from cytosine, thymine, and uracil and x = 6-16, (vii) a nucleotide sequence (CA)xRX, where R is a purime selected from denine and guanine and x = 6-16, (viii) a nucleotide sequence (CA)xRX, where R is a purime selected from cytosine, thymine, and uracil and x = 6-16, and (ix) a combination of the primers. The method is useful for detecting genomic instability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                         This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating a comparising genomic DNA from tumour cells and genomic DNA from tumour cells and genomic DNA from tumour cells and genomic DNA (comparison pair comprising genomic DNA from tumour cells and genomic DNA (comparison) and painte same individual with oligonucleotide primers selected from adenine and yearine and x = 3-7 (ci) a nucleotide sequence (CG)xRY, where R is as in (1) and X is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (ii) a nucleotide sequence (CG)xRY, where R is as in (1) and X is a cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence (CG)xRY, where R is a purime selected from cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence (CA)xRY, where R is a purime selected from denine and guanine and Y is a pyrimidine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where R is a purime selected from denine and guanine selected from adenine and guanine selected from denine and guanine selected from denine and (ix) a combination of the primers The method is useful for detecting genomic instability which are commonly associated with the various stages of neoplastic transformation and carcinogenesis. The method is rapid and simple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating a comparison pair comprising genomic DNA from tumour cells and genomic DNA

trom normal cells. The method involves the cells from the same individual with oligonucleotide primers selected from deanine and sequence (CG)xRG, where R is a purine selected from adenine and sequence (CG)xRG, where R is as in (1) and Y is a complexity of a nucleotide sequence (CG)xRY, where R is as in (1) and x = 3-7, (1ii) and coloride sequence (CG)xRY, where R is as in (1) and x = 3-7, (1ii) and coloride sequence (CG)xRY, where R is as in (1) and x = 3-7, (1iv) a conclectide sequence (CG)xRY, where R is a purine selected from cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence (CG)xRY, where R is a purine selected from deanine and guanine and Y is a pyrimidine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where R is a purine selected from adenine and guanine selected from denine and guanine selected from adenine and guanine selected from adenine and guanine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, and (ix) a combination of the primers The method is useful for detecting genomic instability which are commonly associated with the various stages of neoplastic transformation and carcinogenesis. The method is rapid and simple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating a comparison pair comprising genomic DNA from tunour cells and genomic DNA from normal cells. The method involves the cells from the same individual with oligonucleotide primers selected from (i) a nucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Primer; quantitation; genetic instability; tumour cell; detection; neoplastic transformation; carcinogenesis; DNA/RNA hybrid; ss.

(CG)xRG, where R is a purine selected from adenine and guanine and x = 3-

(i) a nucleotide sequence (CG)xRY, where R is as in (i) and Y is a

pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (iii)

a nucleotide sequence (CG)xRR, where R is as in (i) and x = 3-7, (iv) a

nucleotide sequence (CG)xRY, where Y is a pyrimidine selected from

Cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence

(CA)xRG, where R is a purine selected from adenine and guanine and x = 6-

16, (vi) a nucleotide sequence (CA)xRY, where R is a purine selected from

chymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRR,

where R is a purine selected from adenine and guanine and x = 6-16,

(vii) a nucleotide sequence (CA)xYY, where Y is a pyrimidine selected

CYCOSINE, thymine, and uracil and x = 6-16, and (ix) a combination

of the primers. The method is useful for detecting genomic instability

which are commonly associated with the various stages of neoplastic

transformation and carcinogenesis. The method is rapid and simple
                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting a target PS112 polynucleotide, useful in diagnosing, staging, monitoring, prognosticating, preventing and treating prostate cancer, comprises contacting the test sample with PS112-specific polynucleotide.

The invention describes a method of detecting the presence of a target PS112 polynucleotide in a test sample. The method comprises: contacting the test sample with at least one PS112-specific polynucleotide or its complement; and detecting the presence of the target PS112 polynucleotide in the test sample, where the PS112-specific polynucleotide has at least complements or complements. Also described are: detecting mRNA of PS112 in test sample; a test kit, useful for detecting PS112 polynucleotide in test sample; a test kit, useful for detecting PS112 polynucleotide in test sample; a test kit, useful for detecting PS112 polynucleotide in test sample; a test kit, useful for detecting PS112 polynucleotide in test sample; a test kit, useful for a fragment derived from a PS112 control sequence compatible with a desired host, where the nucleic acid sequence of sequence has at least 50% identity to a sequence of SEQ ID NOS: 1-10, or their fragments or complements; a cell transfected with the recombinant expression system convibence acid sequence comparising at least 50% identity to a sequence comparises SEQ ID NOS: 1-10, or their fragments or complements; a cell transfected with the recombinant expression system complements; a cell sample or its fragment or their fragments of a PS112 polynucleotide or its fragments or or has at least 50% identity with SEQ ID NOS: 2-10, or their complements, or has at least 50% identity with SEQ ID NOS: 9 or 10. The method is DNA having at least 50% identity with SEQ ID NOS: 9 or 10. The method is complements, or has at least 50% identity with SEQ ID NOS: 9 or 10. The method is complement for detecting the presence of a target PS112 polynucleotide in a test sample. The methods, test kit, polynucleotides and polypeptides, and a propositicating, preventing and traating prostate disasses, tumours or metal for detecting, preventing and traating prostate disasses, tumours or metal for detecting the presence of a target PS12 polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Multiple drug resistance; mdr-1; ribozyme; membrane protein; liver; resistance; chemotherapeutic agent; colchicine; doxorubicin; colon; actinomycin p; vinblastine; small intestine; kidney; adrenal gland; adenocarcinoma; bowel; transformed phenotype; promyelocytic leukemia; human; chronic myelogenous leukemia; CML; follicular lymphoma: be-cell acute lymphocytic leukemia; braest cancer; colon carcinoma; neuroblastoma; lung cancer; genetic drift; mutation; hammerhead motif; hairpin; hepatitis delta virus; group I intron; RNaseP; leukaemia; ss.

The sequences given in AAQ51825-2266 represent areas of mRNAs which are associated with development or maintenance of chronic myelogenous cassociated with development or maintenance of chronic myelogenous leukemia, (CML), promyelocytic leukemia, Burkitt's lymphoma, or acute leukemia, CML), promyelocytic leukemia, breaat cancer, colon carcinoma, neuroblastoma and lung cancer. Cleukemia, breaat cancer, colon carcinoma, neuroblastoma and lung cancer. The full length mRNAs containing these target sequences, encode aberant care directly linked to a leukemic phenotype. These target sequences are identified by the ribozyme of the invention. The ribozymes is formed in a confine the may also be formed in the motif of a hairpin, chapatitis delta virus, group I intron or RNaseP-like RNA. These ribozymes can be used to inhibit the development or expression of a transformed corresponding spene. Cleavage of target mRNAs expression of the corresponding spene. Cleavage of target mRNAs expression of the motific and transformed cells elicits inhibition of the transformed state. Multiple drug resistance (mdr-1) mRNA specific ribozymes remove the mechanism of drug theraples for tumours. The ribozymes may also be used to study cancer and mutations within cells.                                                                                                                                                                                                                                                                                                      The invention relates to a drug composition containing as an active component a substance which activates Fc receptor gamma chain. Also included are detecting oligodendroglia and their precursor cells capable of forming myelin (using as an indicator the expression of Fc receptor gamma chain in the precursor cells), investigation of the expression of Fc receptor gamma chain in animal brain tissue (by immune typing, cytochemical analysis, gene amplification or Western blotting) and kits for these methods, containing anti-Fc receptor gamma chain antibody or amplification primers. The drug is used for treatment and prevention of neurodegenerative diseases, and disorders of myelin formation, such as multiple sclerosis, Krabbe's disease, adrenoleukodystrophy and metachromic leukodystrophy. The present sequence is a CD3 delta chain PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              non-human animal model; demyelinating disease; myelinogenesis inhibition; myelinogenesis signal molecules; oligodendroglia; screening; myelin growth regulator; multiple sclerosis; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Non-human animal model for demyelinating disease-related PCR primer #3.

```
PSII2 polynucleotide in a test sample. The method can also be used to detect mRNA of PSII2 in a test sample. The method can be used for diagnosis of prostate cancer, as the presence of PSII2 is an indicator of prostate cancer. Antibodies against the polypeptides may be used as markers, or to treat prostate cancer
                                                                                                 The invention comprises a non-human animal model for demyelinating disease - in which myelinogenesis is inhibited by a defect of myelinogenesis signal molecules in oligodendroglia. The non-human animal model of the invention is useful for screening for a myelin growth regulator, or for screening for a therapeutic agent which is useful for treating a demyelinating disease such as multiple sclerosis. The present DNA sequence represents a PCR primer that was used in an example of the

The invention relates to antisense oligonucleotides targeted to a nucleic acid molecule encoding human Survivin, where the antisense oligonucleotide inhibits the expression of human Survivin. These antisense oligonucleotides are used in the treatment of an animal suffering from a disease or condition associated with Survivin, e.g. a hyperproliferative condition such as cancer, and comprises administering a therapeutically or prophylactically effective amount of the antisense oligonucleotides can also be used to treat a human suffering from a disease or condition characterised by a reduction in apoptosis comprising administering the antisense oligonucleotide to a human. In addition, the antisense oligonucleotide to a human. In addition, the call cycle, or inhibit the proliferation in a cancer cell by contacting the cell vith the antisense oligonucleotide. AAS215A1-AAS21768 represent Survivin nucleic acids, and antisense oligonucleotides targeted to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel compound 8-50 nucleotides in length targeted to a nucleic acid molecule encoding a protein phosphatase 2 catalytic beta subunit, where the compound specifically hybridises with and inhibite the expression of protein phosphatase 2 catalytic beta subunits, or specifically hybridises with at least an 8-nucleotide compounds and active site on a nucleic acid molecule encoding a protein phosphatase 2 catalytic beta subunit and for treating diseases or conditions associated with computating the expression of protein phosphatase 2 catalytic beta subunits and for treating diseases or conditions associated with a subunits and for treating diseases or conditions associated with a berrant insulin regulation or diabetes or a hyperproliferative disorder, particularly cancer. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and in the distinguishing between functions of various members of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                biological pathway. This polynucleotide sequence represents an eligonucleotide inhibitor of rat protein phosphatase 2 catalytic beta subunit mRNA levels of the invention. NOTE: This oligonucleotide contains phosphorothioate residues and has 2'- MOB wings with a deoxy gap
                                                                                                                                                                                                                                                                                                                                                                                                 protein phosphatase 2 catalytic beta subunit; antisense compound; cancer; hyperproliferative disorder; diabetes; inflammation; tumour; rat; ds.
                                                                                                                                                                                                                                                                                                                                                       Cytostatic; antidiabetic; antisense therapy; aberrant insulin regulation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense oligonucleotides targeted to nucleic acid encoding Protein Phosphatase 2 catalytic subunit beta, useful for treating diseases related to Protein Phosphatase 2 catalytic subunit beta expression, such

human neuroblastomas with poor prognosis over those with a good prognosis. The nucleic acids of the invention are useful as a tool for distinguishing neuroblastomas with a favourable prognosis (spontaneous regression) from neuroblastomas with a poor prognosis (high malignancy). The DNA sequences ABT32224 - ABT32571 represent oligonucleotides used in an example of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                              sequence repeat; ISSR; SSR; PCR; primer; genotyping; plant;
                                              Nucleic acids having higher expression in human neuroblastoma with poor prognosis for diagnostic prediction of neuroblastoma prognosis.
                                                                                                         The invention comprises nucleic acids that show increased expression in

New set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes, useful for genotyping diverse genomes of plant and

Claim 1; SEQ ID NO 26; 60pp; English.

genotyping euka animal systems.

The invention relates to a novel set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes. The primers of the invention may be useful for genotyping diverse genomes of plant and animal systems, in particular for distinguishing Basmati rice varieties from non-Basmati rice varieties and traditional Basmati rice varieties from evolved Basmati rice varieties. The current sequence is that of the 3' anchored (ISSR)-PCR primer of the invention.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the intiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, 5' or 3' end genomic flanking regions, 5' or and 1' intron-exon junctions or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or casal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinon: A composition of the invention has antiinflammatory, antiallergic, antiaethmatic, hypotensive, cuse in antisense gene therapy. The composition may have a use in antisense gene therapy. The composition may have a use in antisense gene therapy. The composition may have a use in antisense year therapeutic respiratory effect of an extiniflammatory steroid in a subject, for reducing or depleting levels of for entainflammatory seroid in a subject, for reducing levels of adenosine cofficion producing bronchodilation, increasing levels of adenosine lung suffactant in a subject stissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary dysperension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  chimeric; antisense oligonuclectide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPcES-1; mPcES-1; inhibitor; microsomal prostaglandin E2 synthase; inhibitor; crytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; antiinflammatory; immunomodulatory; cardiant; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; se.

                                                                                                                                                                                                                                                                                                                                                                                                               ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel composition (a) a first active agent, comprising oligonuclectides, effective for alleviating bronchoconstruction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonuclectides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery chartuctions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiathmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered

The present sequence represents a chimeric antisense oligonucleotide charged to human microsomal prostaglandin E2 synthase (mpcBS-1). The human mPGES-1 gene is located on chromosome 9, more specifically to operate on the present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal carrisense oligonucleotides and antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antidiamaticy, neuroprotective, nootropic, antidiamaticy, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound to be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; antiinflammatory; neuroprotective; antiinflammatory; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; s.

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPCES-1). The human mPCES-1 gene is located on chromosome 9, more specifically to 9034.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPCES-1, which specifically whybridise with the nucleic acid encoding inhibite its expression; (2) a method of inhibiting the expression of mPCES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPCES-1. MPCES-1 chimeric antidabetic, immunomodulator, cardiant, neuroprotective, cantidiabetic, immunomodulator, and cardiovascular activities, and can antidiabetic, immunomodulatory and cardiovascular activities, and can be used as mPCES-1 inhibitors and in gene therapy. The antisense compound to used as mPCES-1 inhibitors and in gene therapy. The antisense compound condition associated with mPCES-1 e.g., inflammation, Alzheimer's condition associated with mPCES-1 e.g., inflammation, Alzheimer's chiscase, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                               New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cytostatic, gene therapy, PS112; recombinant expression system;

This invention describes a novel method for identifying an inhibitor of potentially useful for treatment of cancer, where the inhibitor is active on a gene vitel for cell growth or viablity, and where the gene is subject to loss of heterozygosity (LCH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene specific inhibitor (ASI) targeted to an allele of a first essential gene specific inhibitor of the precancerous condition, where the normal somatic calls of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene comment in a population and targets only one allelic forms present in the cused in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic cancers, benigh tumours, endometriosis, polycystic kindry disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-Z26825 represent human polymorphic sites described in the method of the invention
                                                                                                                                                                   Polymorphism; human; inhibitor; cancer; treatment; cell growth; LOH; cell viability; loss of heterozygosity; precancerous condition; ASI; allele specific inhibitor; somatic cell; diagnosis; prevention; atherosclerotic plaque; premalignant metaplastic lesion; endometriosis; dysplastic lesion; benign tumour; polycystic kidney disease; transplant; graft versus host disease; malignant cell removal; bone marrow; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying target genes for allele-specific drugs - used for diagnosis, prevention and treatment of, e.g. cancers, atherosclerotic plaque, dysplastic lesions, endometriosis or graft versus host disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 21 BP; 8 A; 2 C; 6 G; 5 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes a method of detecting the presence of a target PS112 polynucleotide in a test sample. The method comprises: contacting the ps112 polynucleotide or lies complement; and detecting the presence of the target PS112 polynucleotide or lies complement; and detecting the ps112-specific polynucleotide or lies in the test sample, where the PS112-specific polynucleotide has at least in the test sample, where the PS112-specific polynucleotide has at least complements or complements. Also described are: detecting mRNA of PS112 in treagments or complements. Also described are: detecting mRNA of PS112 in test sample; a purified polynucleotide or fragment derived from a PS112 cent a recombinant expression system comprising a nucleic acid sequence that includes an open reading frame derived from PS112 oplynucleotide or fragment derived from a PS112 central sequence compatible with a desired from PS112 oplynucleotide or complements; a cell transfected with the recombinant expression system or with a nucleic acid sequence encoding at least one pS112 epitope, where the nucleic acid sequence encoding at least one pS112 epitope, where the nucleic acid sequence comprises SEQ ID NOS: 1-10, or their fragments or complements, a central polynucleotide or its fragment, where the polynucleotide has at least 50% identity with SEQ ID NOS: 2-10, or their comprising a plant fragments or complements or complements or detecting the presence of starget PS112 polynucleotide in a test sample. The methods, test kit, polynucleotides and polypeptides, and test sample. The methods, test kit, polynucleotides and polypeptides, and tests as an individual to metastases or in determining the predisposition of an individual to metastases or in determining the predisposition of an individual to cequence represents a primer used to sequence eg. prostate cancer. The sequences given in AAQ27805-7 are primers which are complementary to intronic sequences within the amyloid precusor protein gene (APP). They were used to amplify exon 17. APP encodes various isoforms which are precursors of beta-amyloid protein. The beta-amyloid protein is an approx. 4kD protein (39-42 amino acids) which is an internal cleavage fooduct from APP. There are five distinct isoforms of APP containing 563, 695, 714, 751 and 770 amino acids. These are generated by alternative splicing of primary transcripts of APP which is located on human (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Determining the concentration of a target nucleic acid, useful e.g. for detecting genetic mutations, comprises using a fluorescently labeled probe in which emission is reduced by binding to the target nucleic acid.
                                                                                                                                   Polynucleotide probe comprising nucleic acid encoding codon 717 mutant of human APP770, useful for determining genetic pre-disposition to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Kanagawa T, Kamagata Y, Kurata S, Yamada K, Yokomaku T;

The invention relates to the determination of the concentration of a nucleic acid target, using a fluorescently labeled probe which produces reduced fluorescence emission when hybridised to the target nucleic acid. The method comprises meaturing the reduction in emission caused by the method comprises meaturing the reduction in emission caused by a real-time polymerase chain reaction, e.g. for nucleic acids by a real-time polymerase chain reaction, e.g. for quantifying microbial cells in co-cultures or symbiotic systems, for detecting gene mutations or polymorphisms, and for analysing melting curves of target nucleic acids to determine a Tm value. Methods of the invention allow target nucleic acids to be quantified quickly, easily and accurately. Particularly there is no need to remove unbound probe, and on materials are introduced that inhibit amplification by Taq polymerase (so conventional PCR conditions can be used). The specificity of PCR is kept high (amplification of primer dimers is delayed), and the limit of quantitation is reduced. Complex probes are not needed, and amplification can be monitored in real time. The working graph for data analysis (automatically generated by a computer) has a higher correlation coefficient than conventional graphs so more accurate quantitation is possible. The current sequence represents a synthetic quantitation is decaying the base
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Kanagawa T, Kamagata Y, Kurata S, Yamada K, Yokomaku T; Furusho \mathbb{K}_i

Koyama O,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ABL56889;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
```

Determining the concentration of a target nucleic acid, useful e.g. for detecting genetic mutations, comprises using a fluorescently labeled probe in which emission is reduced by binding to the target nucleic acid.

WPI; 2000-657765/64.

The invention relates to the determination of the concentration of

Example 5; Page 21; 55pp; English

The method comprises measuring the reduction in emission caused by hybridisation. The new method is particularly used to quantify target nucleic acids by a real-time polymerase chain reaction, e.g. for nucleic acids by a real-time polymerase chain reaction, e.g. for quantifying microbial cells in co-cultures or symbiotic systems, for detecting gene mutations or polymorphisms, and for analysing melting curves of target nucleic acids to determine a Tm value. Methods of the invention allow target nucleic acids to be quantified quickly, easily and conventional per nucleic acids to be quantified quickly, easily and materials are introduced that inhibit amplification by Tag polymerase (so conventional PCR conditions can be used). The specificity of PCR is kept high (amplification of primer dimers is delayed), and the limit of quantitation is reduced. Complex probes are not needed, and amplification can be monitored in real time. The working graph for data analysis (automatically generated by a computer) has a higher correlation coefficient than conventional graphs so more accurate quantitation is possible. The current sequence represents a synthetic decorate decorate passe

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to a method for measuring nucleic acids using a nucleic acid probe labelled with a fluorochrome. The nucleic acid probe decreases the fluorecence of the fluorochrome when hybridised with a rarget nucleic acid, the decrease in the fluorescence is measured. The method can be used for measuring a target nucleic acid
nucleic acid target, using a fluorescently labeled probe which produces
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The present invention relates to nucleic acid probes, which are useful for assaying nucleic acids by hybridising with a target nucleic acid, in which a single-stranded oligonucleotide is labelled with a fluorescent substance and a quencher in a manner that the fluorescence intensity of the hybridisation reaction system is increased after completion of the hybridisation but no stem loop structure is formed. The probes are useful for assaying nucleic acids and their polymorphism and mutation, particularly useful for e.g. analytical applications, disease diagnosis and microbial identification. The present sequence was used to illustrate
                                                                                                                                                                                                                                                                                                                                                                                 Fluorescently-labeled nucleic acid probes for assaying nucleic acids and their polymorphism and mutation, particularly useful in science and medicine for e.g. analytical applications, disease diagnosis and mirobbial identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Probe; polymorphism detection; mutation detection; disease diagnosis; microbial identification; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Measurement of nucleic acids, using a nucleic acid probe and analysis of the obtained data.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a method for measuring nucleic acids using a nucleic acid probe labelled with a fluorochrome. The nucleic acid probe decreases the fluorescence of the fluorochrome when hybridised with a target nucleic acid, the decrease in the fluorescence is measured. The method can be used for measuring a target nucleic acid

The probes are useful for assaying nucleic acids and their polymorphism and mutation, particularly useful for e.g. analytical applications, disease diagnosis and microbial identification. The present sequence was used to illustrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            HPV infection; replication; cytostatic; virucide; cervical dysplasia; excinoma; oral mucosal cancer; laryngeal; vaccine; gene therapy; double internal trans-acting ribozyme; single; dITRz; CHOP portion; SNIPAA cassette; ss.

                                                                                                                                                                                  The invention relates to a novel method for treating Human papillomavirus (HPV) infection comprising administering to a patient a nucleic acid molecule that inhibits expression associated with HPV replication. The method of the invention has cytostatic and virucide applications and may be useful for treating HPV infections or HPV-associated conditions including cervical dysplasia, cervical carcinoma, oral mucosal cancer and laryngeal cancer. Furthermore, the method may be utilised during vaccine production and gene therapy. The current sequence is that of the HPV-targeted ribozyme (Rz)-related RNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer consisting of a perfect cpd. simple sequence repeat (SSR), and an adaptor
                                                Treating human papilloma virus (HPV) infection, e.g. cervical dysplasias or HPV-associated cervical carcinoma, comprises administering to a patient a nucleic acid molecule that inhibits expression associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Modified amplified fragment length polymorphism assay - for detection of polymorphism esp. in micro:satellite regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present invention describes an isolated, pure population of mammalian neuroepithelial stem cells, which are capable of self-renewal in adherent neuroepithelial stem cells, which are capable of self-renewal in adherent cell-independent (AFCI) culture medium and differentiation to central nervous system (CNS) neuronal or glial cells and to neuronal crest stem cells. Also described is an isolated population of mammalian CNS glial-restricted precursor (GRP) cells which can self-renew in the AFCI culture medium and can differentiate to CNS glial cells but not to CNS neuronal cells. The stem cells can be used to generate a population of mammalian motor neurons by incubating the stem cells in a medium comprises laminin-coated plates and NBP medium lacking chick embryo extract. The stem cells on also produce neural crest stem cells by inducing the cells to differentiate in vitro. The inducing step comprises replating the cells on a laminin-coated substrate and preferably cinducing a dorsalizing chick embryo extract. Inducing can also comprise adding a dorsalizing agent to the cells, preferably a bone morphogenetic protein (BMP) such as
                                                                                                                                                                                                                                                                                                                                                ö
directed primer, comprising a sequence complementary to an adaptor segment. The present sequence is an example of a compound SSR primer. The method represents a modified amplified fragment length polymorphism assay, which is partic. useful for genome fingerprinting, i.e. for genetic trait marking and germplasm comparisons
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mammalian neuroepithelial stem cells and glial restricted precursor - can self renew and differentiate into central nervous system cells, used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Neuroepithelial stem cell; lineage restricted intermediate precursor; oligodendrocyte; self-renewal; neuron; diferentiation; neural crest cell; fibroblast growth factor; FGFR; receptor; CNS; central nervous system; glal cell; PCR primer; amplification; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAA83415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, dermatological, cytostatic, antisebornheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and vincide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermaticis, actinic keratosis, acquamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diseases such as solviant proliferative eye diseases such as diseases such as electinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing correcting such as keloid, adhesion and hypertrophic or hypertrophic burn security such as keloid, adhesion and hypertrophic or hypertrophic burn security such as elected and such as the such as elected and such as keloid, adhesion and hypertrophic or hypertrophic burn and correcting and preventing and preventing secur.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention provides populations of lineage-restricted precursor cells from mouse neural tube and mouse embryonic stem cells. These populations are of neuron-restricted precursor cells (NRPs) and glial-restricted precursor cells (GRPs). These cell populations are useful in the development of new transplant techniques, for transplantation in diseases where neuronal or glial degeneration has occurred, in the identification of drugs which enhance the survival and proliferation of transplanted cells, to identify genes specific to selected stages of development, and in the generation of cell-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New pure populations of neuron- or glial-restricted precursor cells and neuroepithelial stem cells from mouse neural tubes or embryonic stem cells for developing new drugs or techniques that enhance survival of
